

The IP Fire Series™ from AsBuilt™

The red cabinet that keeps your budget black
and your building
GREEN

Consume less natural resources. The IP Fire Series™ from AsBuilt™ consists of a core set of IP based distributable modules that connect over an Ethernet backbone. Modules are installed in the protected premises at their point of use, eliminating the need for long wiring runs back to a central control panel. **This reduces copper consumption while simultaneously offering the added benefit of lower overall installation costs.**

Burn less energy. Our distributed modules take full advantage of the IPF™ system's advanced power distribution methodology. An IPF cabinet with an existing power supply can be tapped to provide the power necessary at remote modules. This ensures that available power is fully utilized before any additional power supplies are added to your system. Why burn energy when you don't have to? Unlike traditional fire alarm control panels that provide integral power supplies in every cabinet (whether you need them or not), the REM cabinet shown above has equal or greater capabilities yet contains no integral power supply. It's IP modules draw their power from an underutilized supply located in another cabinet. Depending on your installation requirements, **the IPF power distribution scheme can substantially reduce standing power consumption.**

Keep it clean. All of AsBuilt's control equipment and detection devices are RoHS compliant. The RoHS directive eliminates many of the hazardous substances commonly used in electronic equipment. **You can breathe easy knowing that AsBuilt's IPF fire control system is free of several hazardous substances including mercury, cadmium, chromium and lead.**

Keep it green. IPF systems offer greater performance capabilities, greater reliability and maximum survivability... all with less copper, less electricity, and no lead... leaving your wallet and your building very **green.**
